

## INDIVIDUAL REFLECTION

---

### **1. What was the most difficult part of interpreting the original author's logic?**

The most difficult part of interpreting the original author's logic was understanding how the backend and APIs were connected. Since I handled most of the backend tasks, I needed to understand how the data moved between the frontend, API, and database. Some parts of the paper and documentation were not explained clearly, so it was difficult to identify how some functions and modules were originally designed. Because of this, I spent time testing different methods to make the system work properly.

### **2. What technical challenges did you face during recreation?**

During the recreation process, I experienced challenges in understanding the system paper because some explanations lacked details. There were also issues with API routing, database connections, and debugging backend errors. Another challenge was making sure that the frontend and backend communicated correctly and that all modules worked together properly. We also encountered problems during testing, which required several adjustments before the system functioned correctly.

### **3. How would you improve this module further?**

If I were to improve this module further, I would make the backend structure more organized and add clearer documentation for the APIs and database. I would also improve error handling and validation to reduce system issues. In addition, I would optimize the database queries and improve the responsiveness of the system to make it easier to use and maintain.
